

PRODUCT OVERVIEW

Your data has answers. Just ask.

Atlas turns the spreadsheets you already have into a conversation. Ask a question in plain English and get verified numbers, a chart and a clear explanation in about a minute, then share it as a polished report.

No formulas

No waiting for reports

Numbers you can trust

The problem every growing business has

The answers are in your data. Getting them out is slow.

Reports arrive late

Sales by branch, top customers, monthly trends: someone has to build them, and it happens at month end, if at all.

One person holds the keys

Pivot tables and formulas live with a single team member. When they are busy, decisions wait.

General AI tools guess

Chatbots produce confident numbers that are simply wrong. For business decisions that is worse than no answer.

What Atlas does

1 Upload your spreadsheet.

Excel or CSV, straight from your billing, POS, ERP or CRM export. Atlas reads every sheet and automatically understands which columns are amounts, dates and categories, and points out data-quality issues such as blank cells or mixed date formats.

2 Ask in plain English.

"Total revenue by region this quarter." "Top 10 customers by order value." "How did expenses trend month by month?" "North versus South." Follow-up questions build on the previous one.

3 Get a verified answer.

A short summary in plain words, the key figures, an interactive chart and the full table. You can always open "How this was computed" to see exactly what was calculated.

4 Share it in one click.

Turn any set of answers into a PDF, Excel or Word report with charts and tables, or export the results as CSV for your own use.

A trend question answered: summary, key figures, chart, and the dataset panel on the right.

Why the numbers can be trusted

Atlas separates understanding from calculating. The AI reads your question; a deterministic calculation engine produces the numbers.

Calculated, never generated

Every total, average, ranking and trend is computed directly from your rows by a maths engine. The AI is not allowed to produce figures.

Explanations are verified

Before you see the summary, every number in it is checked against the computed results. Anything that does not match is removed and flagged.

Messy data is handled honestly

Values like "1,50,000", "\$4,100" or "12%" are read correctly. Blank or unreadable cells are excluded and you are told how many, with examples.

Full transparency

Each answer shows the exact operation, the columns used, the filters applied and how many rows were included. Nothing is hidden.

In practice: if a column contains a value Atlas cannot read as a number, the answer says "3 values in 'Amount' could not be read as numbers and were excluded (examples: 'N/A', 'TBD')". You decide whether that matters.

Questions Atlas answers

YOU ASK	YOU GET
"What is in this file?"	Rows, columns, types, completeness and data-quality notes for every column
"Total sales by region" · "Average order value by product"	Key figures, bar chart, sortable table
"Top 10 customers by revenue" · "Lowest-selling items"	Ranked list with each item's share of the total
"Monthly sales this year" · "Weekly orders"	Line chart with period-over-period change
"North vs South on average deal size"	Side-by-side values, difference and percentage change
"Breakdown of orders by status" · "Distribution of prices"	Frequency chart or histogram

Every uploaded file is profiled: column types, sample values and completeness at a glance.

Built for teams and everyday use

- ✓ Projects keep departments, clients or periods separate
- ✓ Multi-sheet Excel workbooks: one dataset per sheet
- ✓ Every question and answer is saved; pick up where you left off
- ✓ Follow-up suggestions after each answer
- ✓ Chart or table view for every result, CSV export
- ✓ PDF, Excel and Word reports with charts, built from the answers you choose
- ✓ Runs in the browser, nothing to install, light and dark themes
- ✓ Isolated workspaces per account, sessions can be signed out remotely
- ✓ Files up to 100 MB and up to one million rows per sheet
- ✓ Cloud or on-premise deployment on your own infrastructure

The overview: your projects, datasets, questions answered and reports at a glance.

Security and data handling

Your data stays yours

Uploaded files are used only to answer your questions inside your workspace. They are never used to train models.

Access control

Every account is isolated. Sessions expire automatically and can be revoked on sign-out. All traffic is encrypted in transit.

Deployment choice

Use our managed cloud, or run Atlas entirely on your own servers so data never leaves your network.

Auditability

Each answer records the exact plan that produced it, so results can be reviewed and reproduced later.

Getting started

20 min

live demo on your own file

Day 1

first answers from your data

0

software to install

1 click

from answer to report

1 Book a demo.

Send us any spreadsheet, even a messy one, and we will answer your real questions live.

2 Start with one team.

Set up a project, upload the files you use most, and let the team ask questions for two weeks.

3 Roll out.

Add projects for other departments, standardise the monthly report, and retire the manual decks.
