

Atlas Analytics

Conversational business intelligence

INTERNAL · FOR THE CALLING TEAM

Telecaller Product Guide

Everything you need to explain Atlas Analytics with confidence: what it does, who needs it, how to open a call, which questions to ask, and how to answer the objections you will hear most.

September 2026 · v1.0

1 The one-line pitch

Atlas Analytics lets a business owner upload an Excel or CSV file and ask questions about it in plain English. It answers with correct numbers, a chart, and a short explanation, and can turn those answers into a PDF, Excel or Word report.

Say it like this: "You know how you have sales data sitting in Excel and every time you want an answer you have to wait for someone to build a report? Atlas lets you just type the question, like 'total sales by region last quarter', and it gives you the correct answer with a chart in about a minute. No formulas, no analyst."

What it replaces

Waiting for the accounts team or an analyst. Building pivot tables. Hiring a data person for basic reporting.

What makes it different

The numbers are calculated by a maths engine, not guessed by the AI. Every answer shows how it was computed and warns about messy data.

Who buys it

Owners and managers of small and mid-size businesses who live in spreadsheets: distributors, retailers, clinics, agencies, manufacturers, service firms.

2 How it works (explain in 30 seconds)

1 Upload a spreadsheet.

Excel or CSV, any layout. Atlas reads every sheet, understands which columns are money, dates, categories, and flags problems such as blank cells or mixed date formats.

2 Ask a question in plain English.

"Total revenue by region", "top 5 customers", "monthly trend of expenses", "North vs South", "breakdown of order status".

3 Get a verified answer.

A summary in plain words, the key numbers, a chart, and the full table. Numbers are computed exactly from the file; the AI only writes the explanation, and every figure in that explanation is checked against the results.

4 Share it.

One click builds a PDF, Excel or Word report from the answers. Results can also be exported as CSV.

Key trust message: "The AI never invents a number. If the data is messy, Atlas tells you exactly what it skipped and why." Use this line on every call. It is the reason clients trust it over a general chatbot.

3 What Atlas can answer today

TYPE OF QUESTION	EXAMPLE THE CLIENT MIGHT ASK	WHAT THEY GET
Overview of the data	"What is in this file?"	Row and column counts, column types, fill rates, data-quality notes
Totals and averages	"Total sales by region", "average order value by product"	Key numbers, bar chart, table
Rankings	"Top 10 customers by revenue", "lowest-selling products"	Ranked list with share of total
Trends over time	"Monthly sales this year", "weekly orders"	Line chart with month-over-month change
Comparisons	"North vs South", "2023 compared to 2024"	Side-by-side values, difference and percentage change
Breakdowns	"How are orders split by status?", "distribution of prices"	Frequency chart or histogram

Features to mention when relevant

- ✓ Works with messy real-world files: "1,50,000", "\$4,100", "12%", blank cells, extra title rows
- ✓ Multi-sheet Excel workbooks: each sheet becomes its own dataset
- ✓ Follow-up questions understand the previous one ("now break that down by month")
- ✓ Shows "How this was computed" under every answer
- ✓ PDF, Excel and Word reports with charts, built from selected answers
- ✓ Every question is saved; the conversation is there when they come back
- ✓ Projects keep different clients or departments separate
- ✓ Light and dark mode, works in any modern browser, nothing to install

4 Who to call and what to listen for

Best-fit prospects

- Businesses with 10 to 500 staff that run on Excel exports from billing, POS, ERP or CRM systems
- Owner or manager asks the accountant for numbers and waits days
- Sales, distribution, retail chains, clinics and diagnostic centres, agencies, logistics, manufacturing
- Anyone preparing monthly or quarterly review decks by hand

Buying signals (listen for these)

- "I get the report only at month end."
- "Only one person knows how to make that pivot table."
- "I don't trust the numbers in the deck."
- "We tried ChatGPT but it made up figures."
- "I want to see region-wise / product-wise / month-wise."

Discovery questions (ask at least three)

1. Where does your sales or expense data live today? Excel, Tally export, billing software?
2. When you want a number like "sales by branch this month", who prepares it and how long does it take?
3. How many people in your team need these answers?
4. Do you make monthly or quarterly review reports? How are they built today?
5. Have you tried any AI tool for this? What went wrong?

5 Call script

OPENING (15 SECONDS)

"Hi [name], this is [your name] from Valastra. I'll be quick. We built a tool called Atlas that lets you ask questions about your Excel data in plain English and get the correct answer with a chart in under a minute. Do you currently get your sales or expense reports from Excel?"

IF YES

"Great. So today, when you want something like 'which branch sold the most last month', who prepares that for you, and how long does it take?"

BRIDGE TO VALUE

"That's exactly the gap. With Atlas you upload the same Excel file once, type the question, and you get the number, the chart and a short explanation. And the important part: the numbers are calculated by a maths engine, not by the AI, so nothing is made up. If your file has blank cells or odd formats it tells you what it skipped."

ASK FOR THE DEMO

"The fastest way to see it is with your own file. Can we do a 20-minute screen share this week? You send any Excel sheet, even a messy one, and we ask it your real questions live. Would [day] or [day] work?"

IF THEY HESITATE

"No commitment. If it doesn't answer your questions correctly in the demo, we won't follow up. Which day suits you?"

CLOSE

"Perfect, I'll send a calendar invite to [email]. Please keep one Excel file ready. Thank you, [name]."

Goal of every call: book a 20-minute demo with the client's own file. Do not try to sell on the phone.

6 Objections and answers

THEY SAY	YOU SAY
"We already use Excel, we don't need this."	"Atlas works on top of your Excel, it doesn't replace it. It removes the waiting: the answer is typed, not built. Let me show you with your own file."
"AI makes mistakes, I can't trust it with numbers."	"Agreed, and that is exactly why Atlas is built differently. The AI only reads your question and writes the explanation. A separate maths engine does the calculation, and every number in the explanation is checked against the calculation before you see it."
"Our data is confidential."	"Your files stay inside your own workspace and are only used to answer your questions. Each account is isolated, sessions can be signed out remotely, and it can be deployed on your own server if you prefer."
"We tried ChatGPT / Copilot."	"Those are general chat tools. Atlas is built only for spreadsheet questions: it profiles your columns, understands currency and date formats, and shows you how each answer was computed. And it produces the report."
"Our data is messy."	"Most of our clients' data is. Atlas handles blank cells, extra header rows, mixed formats, and tells you what it excluded. Messy files are the best demo."
"What does it cost?"	"Pricing depends on the number of users and datasets. Let's do the demo first and my manager will share the right plan." <u>Confirm current pricing with your manager before quoting.</u>
"We need it in Tally / our ERP directly."	"Today Atlas works from exported Excel or CSV files, which every system produces. Direct connections are on the roadmap; I'll note your system so the team can prioritise it."
"Send me an email."	"Of course. I'll send a one-page overview right away. Can I also pencil a 20-minute slot for [day] so you can see it on your own data?"

7 Do say / Don't say

Do say

- ✓ "Numbers are calculated, never guessed."
- ✓ "Ask in plain English, get a chart and an explanation."
- ✓ "Works on the Excel files you already have."
- ✓ "It tells you what it skipped in messy data."
- ✓ "One click to a PDF, Excel or Word report."
- ✓ "Let's test it on your own file."

Don't say

- ✗ "It predicts the future" or "it forecasts" (it does not, today)
- ✗ "It connects to Tally / SAP / your database directly" (export files only, today)
- ✗ "It's 100% accurate on any question" (say: calculations are exact; it will ask you to rephrase if a question is unclear)
- ✗ "It replaces your accountant"
- ✗ Any price without checking with your manager

8 Quick FAQ

What file types work?

Excel (.xlsx, .xls, .xlsm), CSV and TSV. Up to 100 MB per file.

Does the client need to install anything?

No. It runs in the browser. Chrome, Edge, Safari or Firefox.

How long does an answer take?

Usually 30 to 90 seconds, depending on the question and the AI server load. The screen shows the progress: understanding, computing, explaining.

Can several people use it?

Yes. Each person has an account; projects keep data organised.

What languages?

Questions in English today.

Can it handle big files?

Yes, up to 1 million rows per sheet in the standard setup.

What if a question cannot be answered?

Atlas says so clearly and suggests how to rephrase, for example by naming the column. It never returns a made-up figure.

Is there a free trial?

Confirm the current trial policy with your manager.

Can it run on the client's own server?

Yes, on-premise deployment is available for clients with strict data policies.

Where do I book the demo?

Coordinate through the Valastra team: +91 95385 99750 or +91 63608 62087. Website to share with clients: valastra.in.

Escalate to your manager when: the client asks about pricing, contracts, on-premise deployment, integrations with a specific software, or data-security paperwork. Note the question and promise a same-day reply.
